ABSTRACT

The CPU Information in Computer Technology is a state-of-the-art manner of accessing any information about Central Philippine University. We know that universities as big as CPU needs a more advanced way of letting the people acquire information about the university. These information ranges from degree/course offered in the elementary, high school and the different colleges, enrollment procedures, names and the area where a faculty or staff belongs, library features, the URC facilities and other aspects of the university.

The CPU information system involves a touch screen machine comparable to the Automated Teller Machine where one does a transaction on a single basis. The user touches the main page that would lead him/her to the desired information. The use of the touch screen will not involve a mouse or a keyboard and that it only needs one's finger to operate it. The use of the said system will only take about a few minutes and the user is able to know what he wants.
