ABSTRACT

The study was made to develop a web-based reservation System for Crisme Funeral Homes. It focuses on the following objectives: customize a funeral service so that it will meet the requirements and specification of the customer, create a booking schedule module to manage booking of funeral services, set up a billing and online payment module through online payment, add an inventory module for administration and have a search module to retrieve item information.

For the convenience that the system provides, Crisme can have more customers and can result to increase of sales at the end of the year. They can expand their funeral home business and can open branches in the future. The system can provide all the information that the customer wants to know, and they will not be confused for the product and services they want to purchase.

The proposed Crisme Online Funeral Homes Web-based Reservation System provides good service and how it greatly benefits the customers by rendering quality products and services that customers need through Online Reservation with less effort in choosing the desired products and services because of the concept of add-to-cart and payment through Paypal system. The system automatically updates the inventory after transaction was done so it lessens the time in data recording, and tracking of items. With the aid of this system, it will provide accurate updates of inventory and fast tracking of available items and a report that will be generated.
