## **ABSTRACT**

A special problem paper presented on three problems in pre-construction and construction stages of building technology. These issues include difficulty in processing of building and occupancy permits, complications in inspection works, and misunderstanding due to language differences among engineers and workers.

This guidebook is primarily prepared for Consultants, Inspectors and Contractors of building construction projects. This is to provide them with a practical and systematic approach to solve the three problem issues mentioned. Flowcharts, checklists and a mini-dictionary provide viable solutions to these problems. Moreover, standard MPW Forms and samples of Inspection Forms are provided at the appendices.

It is hoped that this paper will encourage further study and research on the part of architects and engineers who have interest in the field of construction.
